About Me

Results-oriented DevOps Engineer specializing in distributed systems, with proven expertise in designing, implementing, and optimizing scalable, peer-to-peer infrastructure achieving 99.999% uptime across multiple regions. Pioneered an incident response framework, resolving 99% of incidents without business impact. Drove cost reductions while ensuring high availability and deployment efficiency, enhancing developer experience through Infrastructure as Code (IaC) automation. Demonstrates strong leadership and collaboration skills.

Technicals	GitOps	AWS	Distributed Systems
	CICD, ArgoCD, FluxCD	S3, EC2, EKS, ECS, ECR, IAM	Blockchain, P2P, Relayers, IPFS, RPC
	Linux, Bash Scripting	SNS, Terraform, ELB, ALB, EFS	OpenTelemetry, Loki, Prometheus
	GitHub Actions, Circle Ci, Spinnaker	Cloudwatch, SQS, DynamoDB	Grafana, Datadog, Gateway API
	Ansible, Kubebuilder, Operators	IaC, Lambda, Route53, Boto3	Microservices, Docker, kubernetes, Helm
	Python, Go, Terraform, Pulumi, Git	OIDC, SSM, KMS, Okta, Splunk	Go, EVM, ZK Provers

Strength - Skills	DevX	Distributed Systems	Collaboration
	- Developed multi-region environments for fault tolerant systems - Built scalable systems based on developer experience feedback	- Operated and maintained distributed infrastructure and microservices - Designed and managed end-to-end CI/CD for MPC protocol (P2P) and chain abstraction	- Communicated, provided feedback, analyzed problems, and presented strategies - Led, designed, and managed infrastructure aligned with business domains

Experience	Full-Time Parenting Career Break - Took some time off to take care of my Son. - Helped my wife (First-Time Mother) to raise our first child.	Feb 2025 - Oct 2025
------------	---	---------------------

Senior DevOps Engineer	Dec 2022 - Feb 2025
ChainSafe - Sygma: Interoperability Bridge Protocol & Chain Abstraction	
Infrastructure Ownership: Managed Sygma's P2P distributed infrastructure for over 2 years, converting manual processes to Infrastructure as Code (IaC) using Terraform and Terragrunt. Imported existing AWS resources into Terraform state, implemented Ansible for Configuration as Code, and adopted GitOps principles for seamless rollbacks and reconciliation. Infrastructure Optimization: Developed reusable Terraform modules, slashing provisioning time by 99.41% (from 3.5 days to 30 mins), cutting operational costs by \$1,265.03, and enhancing consistency via GitOps and automated releases. Multi-Region Multi-Cloud Scalability: Enhanced Sygma MPC nodes from single-point-of-failure to fault-tolerant, multi-region/multi-cloud architecture (Frankfurt, N. California, Singapore), boosting uptime to 99.999%. Collaborated with external partners (node operators) to establish a globally distributed network. Latency Optimization: Reduced Sygma's costs by 23% on IPFS and 88% on compute by addressing latency and network failures in the MPC Bridge. Achieved this by replacing the config-server with S3 static file hosting for the topology map. CI/CD Optimization: Improved deployment speed by 80% by consolidating five runners to a single runner using parallelism. Enhanced CI/CD pipeline flexibility by 86% with Jinja2 templating for dynamic JSON-based ECS configurations at runtime. Collaboration - External Partners: Collaborated with node operators to run Sygma MPC Bridge nodes. Developed Terraform onboarding scripts, CI/CD pipelines, and documentation, enabling partners to join the Sygma Bridge network in under a day. Prover Zksync: Collaborated with ChainSafe researchers to develop Spectre, a Rust-based Zksync implementation. Created Docker images and technical documentation for operating Spectre-Prover for external users. Blockchain RPCs: Pioneered self-healing RPC gateways for public, private, and SaaS endpoints with continuous health checks, prioritizing public nodes to reduce SaaS RPC usage and costs by 53.3%, while improving reliability from 75.3% to 99.999%. Linux: Improved deployments by 45% with Ansible playbooks and workspaces to automate and manage Ethereum nodes (Sepolia, Holesky, Goerli) on OVH bare-metal servers. Configured monitoring and observability using Promtail, Loki, Prometheus, and Grafana. Cross-Org Deployment: Established GitHub as the source of truth for multiple repositories, enhancing security for public repos (source) and preventing sensitive data exposure in private repos (configurations). Implemented token-based access with need-to-access restrictions. Security: Reduced CI/CD pipeline attack surface by 43% with OpenID Connect (OIDC) and AWS trust policies, enforced two-repo strategies to prevent data exposure, and set up least-privilege Security Groups and IAM roles. Cost Optimization: Reduced annual AWS CloudWatch Logs costs by \$9,840 (from \$11,280 to \$1,440) by optimizing log retention and redirecting ingestion to Loki, eliminating CloudWatch storage. Saved over \$80,000 by migrating logs from Datadog to in-house Loki/Grafana. Observability: Built an OpenTelemetry adapter for collecting metrics from distributed P2P nodes. Developed a	

serverless Functions-as-a-Service application (using Python, Boto3, and AWS Lambda) to stream logs from AWS SNS to Loki/Grafana, enabling real-time monitoring of SNS invocations with custom PromQL queries.

● **Incident Management:** Spearheaded and contributed to the creation of the incident response framework, launching Sygma Incident Management. Introduced mock drills for incident handling, performed Root Cause Analysis (RCA), resolved 99% of incidents, and coordinated on-call duties and postmortems.

Key Achievements

- Improved IaC efficiency by developing reusable Terraform modules, cutting provisioning time by 57.6%.
- Scaled Sygma infrastructure to multi-availability zones and multi-regions, improving uptime from 95% to 99.999%.
- Improved deployment times from 15 minutes to 2 minutes through pipeline optimizations, enhancing developer experience and productivity.
- Pioneered RPC Gateway, improving reliability by 95% and saving RPC costs by 53.3%.
- Reduced annual AWS ECR container storage and data transfer costs by 99% through GitHub Container Registry adoption.
- Pioneered Sygma incident response, resolving 99% of incidents without business impact.
- Improved observability with customer-facing metrics and search fields for quick monitoring of API interactions.
- Reduced infrastructure costs by 33.3% by migrating compute-intensive workloads to bare-metal ZK coprocessors for verifying Beacon chain headers via Altair lightclient protocol.

Tools

AWS, Terraform, Go, GitOps, Git, GitHub Actions, MongoDB, Container Registry, Docker, Slack, Serverless, SSM, ASM, IAM, KMS, ECS, EC2, S3, SNS, Notion, Loki, Grafana, Datadog

DevOps Engineer II

Oct 2021 - June 2022

Bitso

- **Developer Enablement Engineer:** Managed Kubernetes environments (Dev, Stage, Prod) to support crypto-token microservices for 5M+ users.
- Configured AWS EKS ingress and overlay networks (e.g., Istio) for service discovery, performing scaling, rolling updates, and rollbacks to maintain 99.9% uptime.
- Implemented Kubernetes service health checks for Java (Spring, Micronaut) frameworks, resolving startup failures.
- Created reliable end-to-end CI/CD pipelines (build, test, deploy, monitor), improving developer experience, automating deployments across Kubernetes environments, and reducing manual processes.
- Introduced Java library publishing on GitHub with CI/CD release pipelines using GitHub Actions, reducing deployment time by 80%.
- Designed and implemented microservices environments for listing crypto-tokens, developing templates to automate CI/CD tooling, and maintained fault-tolerant pipelines for production serving 5M+ users.
- Developed pipelines for Java libraries (Spring, Micronaut) with GitOps and Cookiecutter, integrating continuous testing on CircleCI with test containers.
- Automated Java build processes with Gradle, GitOps, GitHub Actions, Python, and Bash.
- Created decentralized GitHub packages as internal libraries with GitHub Gateway.
- Introduced engineering onboarding programs, documented processes for users and engineers, and collaborated to identify and resolve tech debt.
- Created a roadmap to improve engineering communication and organizational strategy.

Tools

CircleCI, Spinnaker, Bash, GitOps, Git, GitHub, Gradle, Slack, Groovy, DSL, Asdf, EKS, ECR, Helm, Docker, Python, Terraform, Atlantis, GitHub API, API Gateway, KMS, EC2, S3, Jira, DynamoDB, Splunk, Komodor, Okta

DevOps Engineer

Oct 2018 - Sept 2021

Real-Time Integrated Technologies

- Delivered continuous integration and delivery for a Machine-Learning Flask application using CircleCI, Git, and GitHub.
- Built, deployed, tested, monitored, and maintained Blue-Green CI/CD pipelines for containerized workloads on AWS.
- Refactored a Machine-Learning Flask application to microservices, deployed using Pip, CircleCI, and GitHub.
- Developed and deployed an image filtering API on AWS Elastic Beanstalk using TypeScript and Node.js.
- Refactored a Node.js application to microservices, deployed on EKS clusters with Travis CI, and scaled with CPU and memory requests.
- Refactored a monolith e-commerce app to serverless architecture using AWS Lambda, API Gateway, DynamoDB, S3, and Node.js.
- Designed elastic infrastructure with Terraform to host a social media application for 50,000 users.
- Designed serverless architecture for remote developers with proof-of-concept.
- Integrated and deployed end-to-end distributed tracing with Jaeger Operator on EKS for monitoring and observability.
- Deployed Kube-Prometheus and metrics-aggregator on Kubernetes using Helm.
- Monitored and observed Kubernetes workloads with Grafana custom metrics (CPU, Memory) and troubleshooted with distributed tracing.
- Secured web applications with IAM policies, AWS Inspector, GuardDuty, AWS Config, and S3 encryption.
- Recovered failed web applications using S3 versioning.
- Mitigated malware on Ubuntu 18.04 via vulnerability testing with OpenVAS, YARA, and CVE.
- Conducted security audits with the DREAD model and implemented risk remediation with bcrypt and Python using SHA-512.

Tools

Terraform, CloudFormation, Jenkins, EKS, Elastic Beanstalk, GitHub, Groovy, Node.js, TypeScript, Python

Education

Bachelor's Degree in Computer Science (Cyber Security)

Federal University of Technology, Minna, Nigeria, 2018

- Certifications
- Certified GitOps At Scale
 - AWS Certified Cloud Practitioner
 - GitLab Certified Associate
 - Certified Apache Cassandra in Kubernetes
 - SkillFront Lean Foundations Professional
 - IBM Enterprise Design Thinking Practitioner
- [For more Credentials](#)
